AGGREGATION OPERATORS

In MongoDB, the **Aggregation framework** is a powerful tool for data processing and transformation. It uses a pipeline approach, where data is passed through a series of stages, each performing a specific operation.

The stages in pipeline can filter, sort, group, reshape and modify documents that pass through the pipeline.

The name itself says that Aggregation means grouping together. For example: **Sum,Avg,Min,Max**.

Syntax for the Aggregation Operator is **db.collection.aggregate(<AGGREGATE OPERATION>**).

types of AggregAtion operators:

Expression Type	Description	Syntax
Accumulators	Perform calculations on entire groups of documents	
* \$sum	Calculates the sum of all values in a numeric field within a group.	"\$fieldName": { \$sum: "\$fieldName" }
* \$avg	Calculates the average of all values in a numeric field within a group.	"\$fieldName": { \$avg: "\$fieldName" }
* \$min	Finds the minimum value in a field within a group.	"\$fieldName": { \$min: "\$fieldName" }
* \$max	Finds the maximum value in a field within a group.	"\$fieldName": { \$max: "\$fieldName" }
* \$push	Creates an array containing all unique or duplicate values from a field	"\$arrayName": { \$push: "\$fieldName" }
* \$addToSet	Creates an array containing only unique values from a field within a group.	"\$arrayName": { \$addToSet: "\$fieldName" }
* \$first	Returns the first value in a field within a group (or entire collection).	"\$fieldName": { \$first: "\$fieldName" }
* \$last	Returns the last value in a field within a group (or entire collection).	"\$fieldName": { \$last: "\$fieldName" }

To perform aggregation operator lets import a collection called students" through mongocompass.

To switch this database we must use a commands like

"use db"

"show dbs"

"show collections"

1.\$sum:

Here is an example to find averagesum of gpa for all the home cities for this we have to use a command like

db.students.aggregate([\$group:{_id:"\$home_city",averagesum:"\$gpa" }}}]);

Here we used,

__id:home_city:-which sets the identifier the homecity to document together.

Averagesum:-calculates the averagesum value of students who scored particular gpa field in home cities using **\$sum operator.**

2.\$avg:

Here to find averageGPA of all the students we need to use a command

db.students.aggregate([{\$group:{_id:null,averageGPA:{\$avg:"\$gpa"}} }]);

```
db> db.students.aggregate([{$group:{_id:null,averageGPA:{$avg:"$gpa"}}}]);
[ { _id: null, averageGPA: 2.98556 } ]
...
```

One more example using **\$avg operator**, Here we are finding average gpa for all home cities use a command is

db.students.aggregate([{\$group:{_id:"\$home_city",averagGPA:{\$av g: "\$gpa"}}}]);

3.\$min and \$max:

To find Minimum and Maximum age we need to use a command called

db.students.aggreagte([{\$group:{_id:null,minAge:{\$min:"\$age"},max
Age:{\$max:"\$age"}}}]);

```
db> db.students.aggregate([ {$group:{_id:null,minAge:{$min:"$age"},maxAge:{$max:"$age"}}}]);
[ { _id: null, minAge: 18, maxAge: 25 } ]
```

using **\$min and \$max** operator we found a minimum value and maximum value of age field.

4**.\$push**:

Here pushing all the courses into a single array using \$push operator to receive an array in order.

db.students.aggregate([{\$project:{_id:0,allCourses:{\$push:"\$courses"}}}]);

```
db> db.students.aggregate([{$project:{_id:0,allCourses:{$push:"$courses"}}}]);
MongoServerError[Location31325]: Invalid $project :: caused by :: Unknown expression $push
db> _
```

Here we used

\$project:- Transforms the input documents.

_ id: 0:-Excludes the _id field from the output documents.

<u>allCourses</u>:- Uses the **\$push operator** to create an array. It pushes all elements from the "courses" field of each student document into the allCourses array.

Result:

This will return a list of documents, each with an allCourses array containing all unique courses offered.

We received an output like **invalid \$project** this is because our Array is incorrect.

5.\$addToSet:

To collect unique courses offered we use a command called

db.candidates.aggregate([{ \$unwind: "\$courses" }, { \$group: { _id: null, uniqueCourses: { \$addToSet:"\$courses" } } }]);

```
db> db.candidates.aggregate(({Sunwind: "Scourses"), {Sgroup:{_id:null, uniqueCourses: {SaddToSet: "$courses"}}}));

{
    id: null,
    uniqueCourses: [
        'Statistics',
        'Psychology',
        'Engineering',
        'Robotics',
        'Sociology',
        'Marhematics',
        'Biology',
        'Environmental Science',
        'Creative Writing',
        'Film Studies',
        'Computer Science',
        'Artificial Intelligence',
        'Cybersecurity',
        'Art History',
        'Literature',
        English',
        'Political Science',
        'Philosophy',
        'History',
        'Clemistry',
        'Chemistry',
        'Chemistry',
        'Cology',
        'Music History'
}
```

In output we got all the Unique courses which were offered to students.
